

# ***GeroCare*: A One-Stop Solution for Geriatric Care**

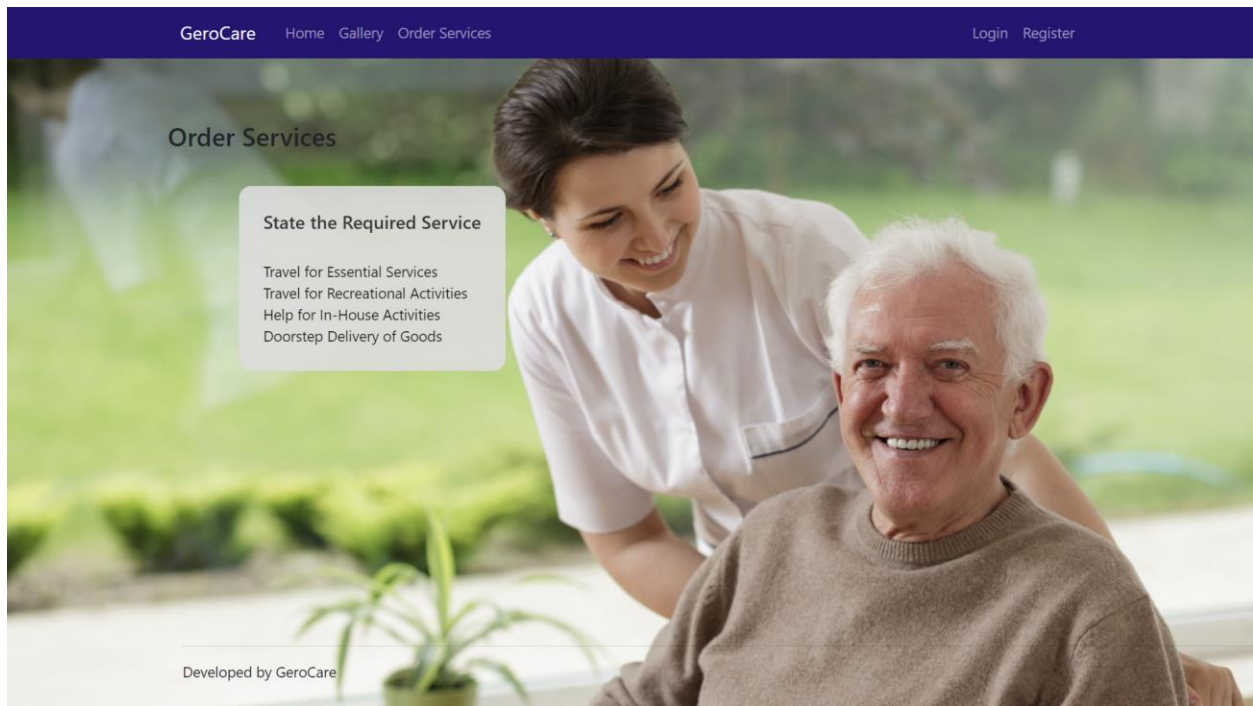

## **Instruction Manual for Web Application**

1. Open 'home.html' file in a web browser, preferably Google Chrome. This opens the Home page of the web app. The home page details various features of *GeroCare*.

2. The top navigation bar can be used to easily access the different pages of the website
3. The pages within 'Order Services' are made to have plain background to make it legible and easy-to-use for the geriatrics.
4. Since only the front-end has been developed till date, data processing and logging in through a particular kind of account is not possible
5. Required services are to be chosen from among the 4 options in 'Order Services' tab. The first two options, 'Travel for Essential Services' and 'Travel for Recreational Activities' allow to check availability of Taxis nearby through Ola API, in addition to availing volunteer-assisted travel to places.
6. 'Help for In-House Activities' enables the user to request bedside care, help for household chores, etc.
7. Buying goods/ medicines from a store and pick-up of bought goods can be done using the 'Doorstep Delivery of Goods' option.

## Real-world Mechanism

1. On ordering a service by the geriatric or working adult, the request is forwarded to the set of volunteers who fall in the preferred kind (mentioned by the geriatric during registration) and whose 'Category of Care' matches with the current need.
2. Once a volunteer accepts the request, he/ she has to meet up with the geriatric and assist for the travel and drop the geriatric back at home, in the first two services.
3. In the third service, he/ she visits the geriatric's house and helps with the requested chores.
4. In the fourth service, he/ she goes to the store, does the necessary transactions, and takes the goods to the doorstep of the geriatric.
